

Handwriting.

Data.

Results.

Innovios - our company.

Innovios has been established to deliver Intelligent solutions and Innovative systems to business. Dink harnesses the power of handwriting and computers to deliver flexible and powerful data management applications intuitively.

Our staff and technology partners combine all the experience, competence, and knowledge to be committed with all their energy for your ideas and goals.

We support organisations in the improvement of documentation and information management processes.

Our solutions for optimal data capture and provision help our customers to increase their efficiency and profitability.

We see ourselves as a partner for innovation, strategy and technical solutions and feel responsible for the success of our customers.

Imagine you capture data with pen and paper and at the same time use one of the most innovative types of digital data capture.

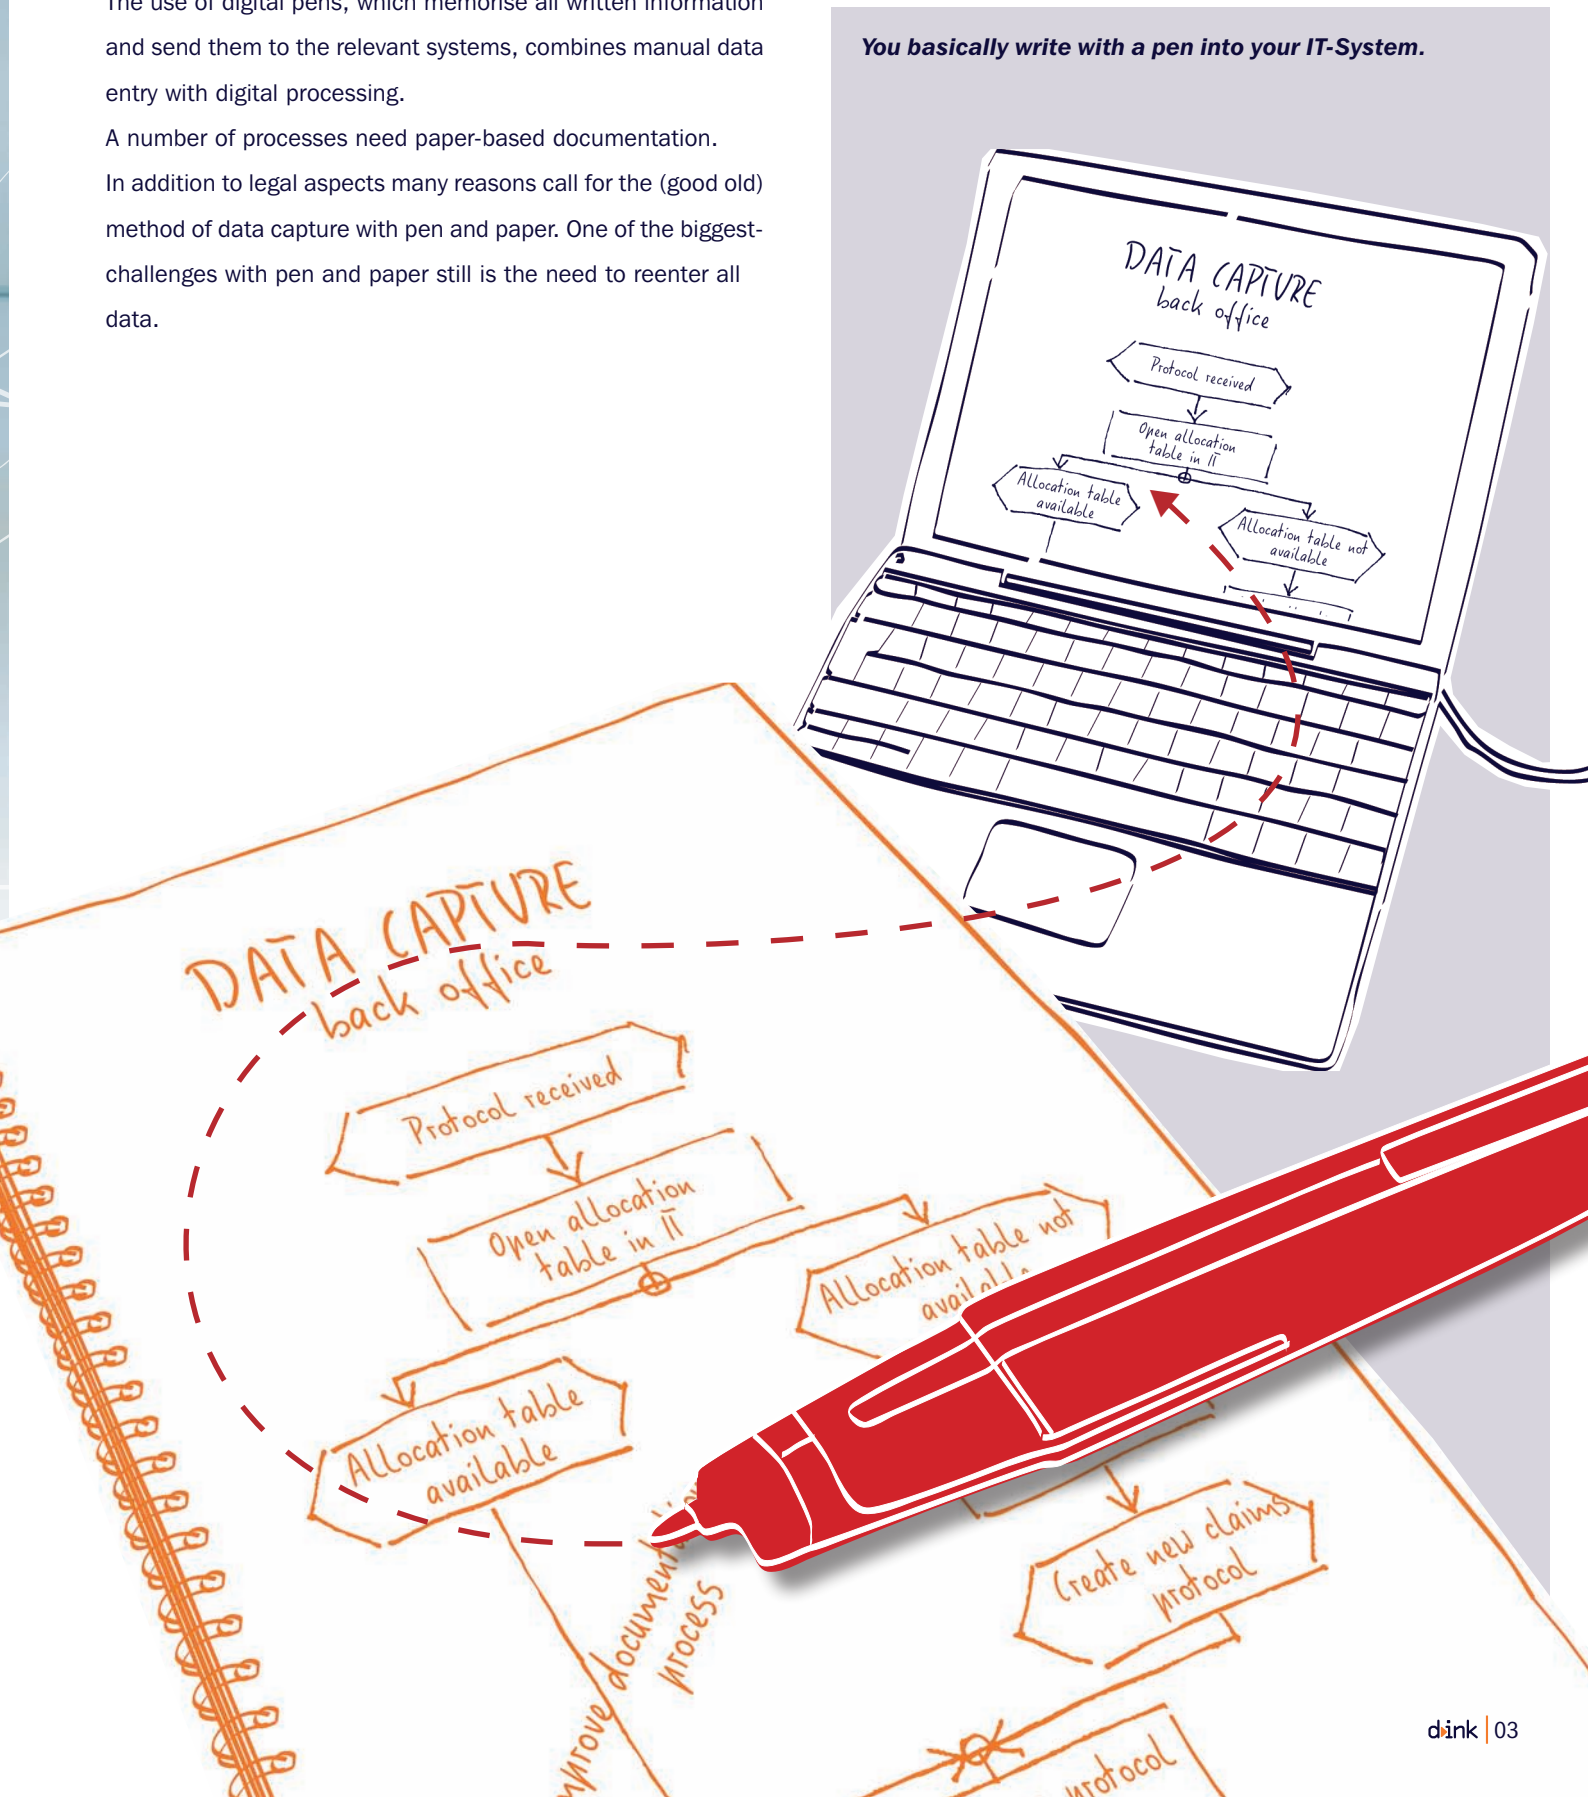

The use of digital pens, which memorise all written information and send them to the relevant systems, combines manual data entry with digital processing.

A number of processes need paper-based documentation. In addition to legal aspects many reasons call for the (good old) method of data capture with pen and paper. One of the biggest challenges with pen and paper still is the need to reenter all data.

Our systems transfer handwritten information automatically from the pen into your IT-system.

Data is captured, converted, analysed and provided in a structured format.

You basically write with a pen into your IT-System.

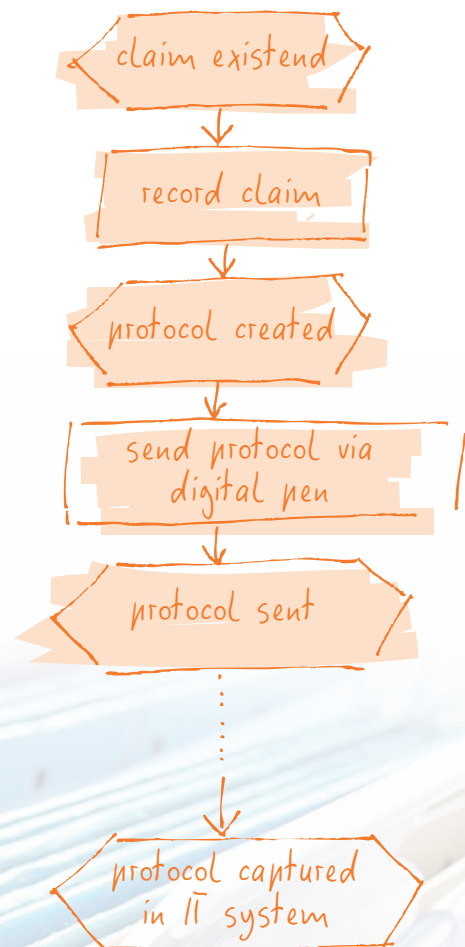

Paper-based processes

The easiest way of capturing and preserving data to make information available is scripture.

Handwriting with pen and paper still is the most efficient method of structured recording of data. Every day millions of doctors, policemen, construction engineers, social workers, managers, and many more in all kinds of professions use pen and paper to record information which they need to make far-reaching decisions.

Process is improved/accelerated

DATA CAPTURE Innovios system

As simple and practical as handwritten documentation is, this method can lead to various challenges in distributed processes. Most data needs to be processed and analysed and available in the systems in a very short time frame independent of location.

The solution is to combine the efficient and practical method of handwritten data capture with the enormous capability of modern information technologies.

Overcoming double entry

The conversion of handwritten data into processable data necessitates an additional process step which neither adds value for the organisation nor does it improve communication and data processing.

The transfer of data from one format to another one results in additional costs, prolongation of process times and reductions in the quality of workflows.

And this procedure is error-prone.

Alternative methods like entering data into mobile IT devices directly at the place of data generation are of only limited use.

In many areas processes and their performance are not improved with the use of those mobile devices.

The solution is to keep the optimal documentation process and convert handwritten information automatically into electronic data.

„Evolution“

Tools for data capture.

„Progress is the road from the primitive via the complicated to the simple“

Werner von Braun

► Proven

Handwritten data capture. Since centuries the most efficient method for saving and exchange of information.

► Ergonomic

Immediate feedback from IT-systems to handwritten requests.

► Ideal

Data transformation and transfer without loss of quality within seconds. Cost savings at every single documentation process.

► Quick

No need to transport paper documents - only the contained information are transmitted.

► Economic

Electronic information processing - the most effective method for analysing, making data available and storing information.

► Low budget

Expenses for training, hardware, licenses for different software, support and maintenance extremely limited.

► Simple

Separate paperbased and electronic archiving not necessary any more. Automatic generation of electronic graphical document copy next to the data record.

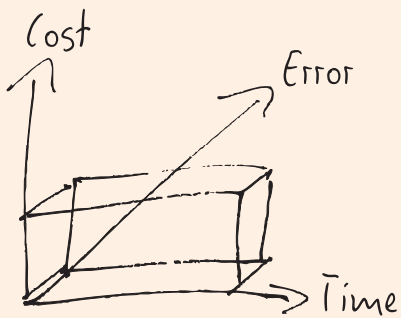

► Independent

Data capture and transmission wherever needed.

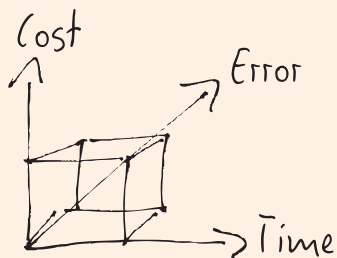

We analyse processes and establish structures.

Problem

Solution

The improvement of processes call for a deep understanding of existing structures. We meet the complex challenges of our customers and create strategies to assure their long-term success.

Finding a solution means knowing the implications of changes to the structures of an organisation.

Creating and implementing a solution means using capabilities in an optimal way, applying the right methods and tools and accompanying the people during the change process.

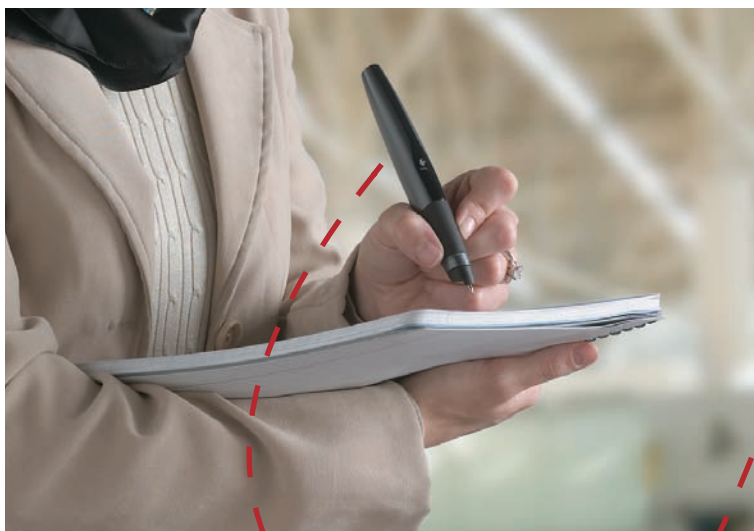

Our consultants are equipped with extensive competencies and experience. They stand for the success of their projects. Our team of developers and engineers adapt tools and communication paths exactly to the requirements of specific processes.

We make sure that notes convert into data which can be processed and integrated.

All dots and strokes on the paper are recorded by the digital pen. Our systems analyse the data delivered by the pen and transfer them into the form needed for further processing.

➤ **Imagine that every single field on a form and every area on a sheet of paper tell your pen its use and what should be done with data written on it.**

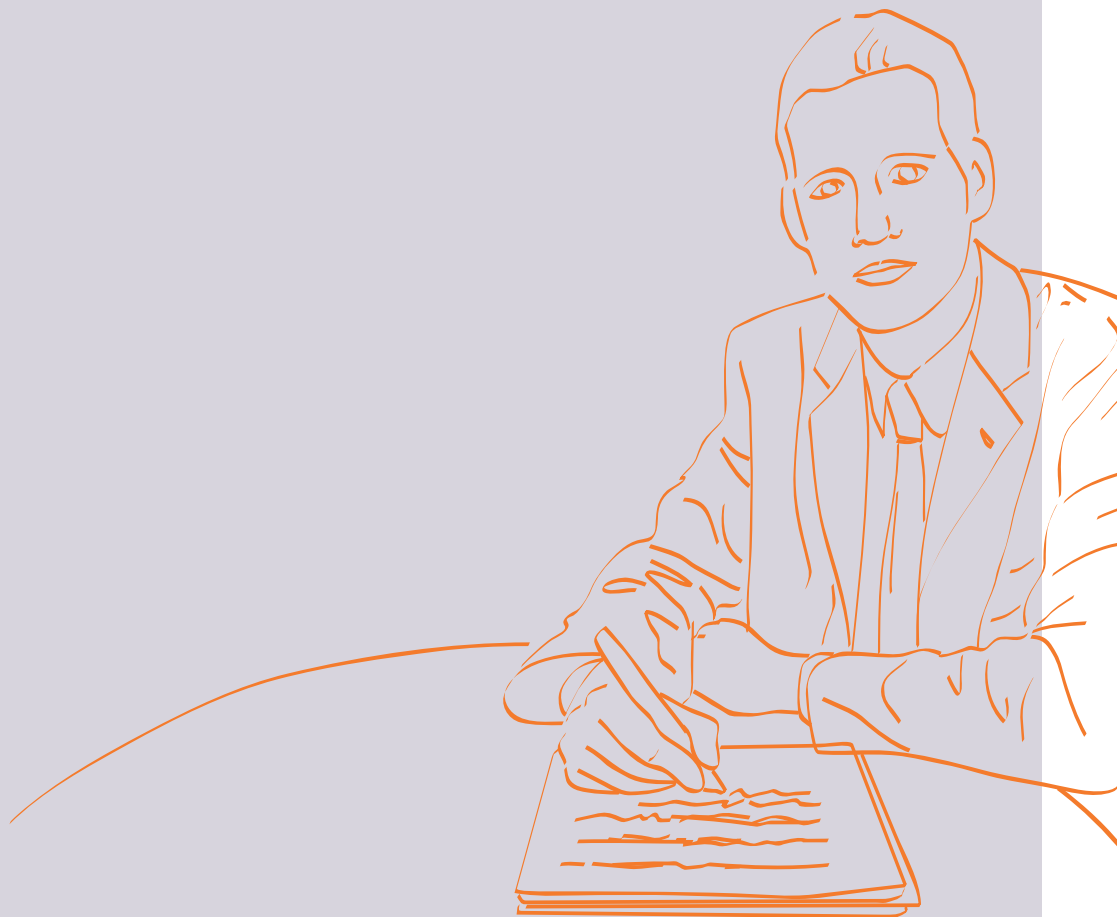

➤ **Imagine a document is being filled out by different people at different times and you always have the latest-version of the notes in your system - and you know who made which entry at what time.**

➤ **Imagine you capture data with pen and paper and you receive an automatic message to your mobile phone for confirmation or about the state of processing of your data.**

Our systems enable organisations to use optimal processes for documentation and information management.

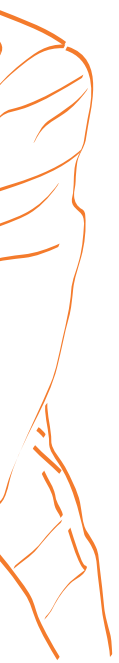

For every environment and requirement the right solution to improve processes.

Why you should use an Innovios-System:

- *Data capture with pen and paper and still the most modern form of data capture and processing*
- *No additional manual transcription of data into IT-systems resulting in enormous time savings and elimination of error-prone subprocesses*
- *Mobile usage, practicability, ergonomics and automatic data transfer – closing gaps with an Innovios system*
- *Methods and tools – Innovios looks at the challenges from a broader perspective and offers competences in consulting and software development*
- *Innovios creates individual solutions*

Do not hesitate to contact us.

We would like to convince you personally of the advantages of an Innovios system.

Try yourself what functionality our systems offer and how you handle them.

Request more information about our solutions and services. We gladly make industry specific information available to you.

We also appreciate it if we can add you to our mailing-list for information about the latest solutions and developments.
